THE CALL TO *Action!*

A LITTLE over six years ago our country was faced with catastrophe, and for almost four years we fought disaster with every weapon at our command. One of the most potent of these was the Victory Garden, and the faithful effort of home gardeners contributed greatly to final success.

Now we are troubled by another situation; one which can have equally dire effects. Many of our neighbors in other lands are suffering from extreme privation, and our decision on their relief may have much to do with the result.

Our government has taken its stand and issued a call—TWENTY MILLION FREEDOM GARDENS FOR 1948. The object—to have each one of us make him or herself partially self-sustaining and thus do a share toward helping this badly muddled world.

Gardeners everywhere will respond, beyond a shadow of doubt. Throughout 130 years of Breck's history there have been many such calls, and the gardeners of the nation have always worked shoulder to shoulder through every emergency.

Now, once again, Breck's stands ready to help by providing seeds and implements—the weapons of peace.

U710 VELTURF. The finest mixture of quality grasses for the home lawn that money can buy. It is made up of fast growing varieties which will start quickly and produce a fine, close lawn within a few weeks, together with such permanent grasses as Colonial Bent and the Illahee strain of Red Fescue which gradually replace the former to form a turf which will last for years, if given reasonable care. This permanent lawn will have a fine, even texture of the richest green color; it will stand the severest cold of Winter and withstand the heat of Summer. Breck's "Velturf" is guaranteed to contain no crabgrass seed and because of the luxuriant close textured turf when established crabgrass has little chance for survival. We recommend this grand grass seed mixture highly.

1 BREXONE TURF-GRO. The Modern Plant Food. Will bring out the full beauty of your lawn and give you the thick, cushion-like turf you desire.

5331 Brussels Sprouts

BRUSSELS SPROUTS

Time to Plant—Sow indoors or in a coldframe about March 15 or in the garden from about April 20 until May 20.

Soil—A deep, rich, well drained soil is essential. It must not be wet or sour for failure will result.

See Sowing—Sow in flats or in sheltered seed beds of finely pulverized loam. Broadcast the seed thinly over the surface and cover lightly (no more than $\frac{1}{4}$ inch) with finely sifted soil.

Culture—When the resulting plants are large enough to handle, thin out and transplant to the garden after May 1. Set the plants about 18 inches apart in rows with about $2\frac{1}{2}$ feet between the rows.

1 ounce of seed should produce about 2000 plants

- 5331 Long Island Mammoth.** 120 days. Seed of the highest selection. Sprouts thickly set, good size and of excellent quality. Fine for freezing. Pkt. 25c., $\frac{1}{2}$ oz. \$1.00, oz. \$1.85

BEETS

Time to Plant—Sow quite early in the Spring (about April 20) and at intervals, from then until about July 25.

Soil Preparation—A light, rich soil is best. Do not use fresh manure for it will cause the roots to become scabby. Old, well rotted manure well mixed with the soil is excellent; also a standard vegetable fertilizer with a high potash content.

Planting—Sow the seed thinly in rows and later thin out so that the plants will stand about 2 inches apart. Allow about 1½ feet of space between rows.

1 ounce of seed should sow a 50-foot row

All varieties are suitable for freezing.

5274 Early Wonder. 49 to 52 days. Has a small top and therefore is an excellent Beet for bunching. Roots somewhat top-shaped of uniform color and good quality.

Pkt. 10c., ½ oz. 20c., oz. 35c., ¼ lb. \$1.00

5279 Beats All. 60 days. Generally considered an excellent all-round early or main crop Beet for the home garden and general planting. The tops are small, upright in growth; leaves dark green, shaded with red; color uniformly deep red; flesh, a vermilion-red zoned with a slightly lighter shade of same color.

SWEET CORN

Time to Plant—Sweet Corn is a rather tender plant and therefore seed should not usually be planted until about May 1 and then only if the weather is settled and reasonably warm. Plantings may be made at intervals, from that time until about July 1 using early varieties for the later sowings.

Seed Sowing In the home garden it is best to sow Corn in rows which should be spaced about 3 feet apart. The seed should be sown very thinly; covered to a depth of one inch and the resulting plants thinned to stand about one foot apart. In larger field plantings the usual practice is to plant in hills spaced at least 3 feet apart each way. Four or five plants are allowed to each hill.

1 pound of Corn should plant a 200 foot row

Lettuce

Time to Sow—If a very early crop is desired, seed may be sown about March 15 indoors in flats or in a coldframe; outdoors sowings may be made as early as April 1 and successively until about June 1. Planting—Sow the seeds outdoors in rows 2 feet apart and cover with not over $\frac{1}{4}$ inch of soil. When the plants are large enough to handle thin out and use or transplant to other rows, allowing 1 foot between plants. **1 ounce of seed should produce about 3000 plants.**

GARDEN PEAS

Time to Plant—Just as early in the Spring as the soil is workable (about April 1).

Soil Preparation—Any good garden soil which has been deeply spaded and liberally manured. Peas dislike acid soil and if such a condition exists, it should be corrected by working in lime (about 5 lbs. to each 100 square feet).

Planting—Sow in drills, allowing one inch between seeds and about 3 feet between rows. Cover the seed with about one inch of soil.

Cultivation—As soon as they begin to grow, some form of support should be provided for all but the very dwarf varieties. (Birch brush or poultry wire). Constant cultivation will add considerably to the quality of the crop.

1 lb. of seed will sow about a 50 foot row

SEED POTATOES

CERTIFIED STOCK

Aroostook Potatoes, certified as seed stock by the Maine Department of Agriculture.

Potatoes should be planted during April or early May. They will thrive in almost any fertile, well-drained, somewhat acid soil. Do not use lime. The soil should be plowed or deeply dug over and furrows 6 inches deep and $2\frac{1}{2}$ to 3 feet apart, should be made. A commercial fertilizer with high phosphorus and potash content should be thoroughly mixed with the soil at the bottom of the furrow about 20 lbs. per 100 ft. row and about 2 inches of unfertilized topsoil should be placed over it.

Cut each Potato into three or more pieces with at least one good eye to the piece. Treat with Semesan-Bel and plant, about 10 inches apart, in the prepared furrows. Cover with 3 or 4 inches of soil. Cultivate constantly throughout the season. *10 bushels are sufficient to plant one acre*

Although Sweet Potatoes are commonly associated with the South, they can be grown with relative ease and amazing success in the home gardens of New England. You can't imagine how delicious they are until you have enjoyed the products of your own efforts. After the weather has become warm, set the plants 1 foot apart in rows that have been hilled up to 6 inches above the level of the ground. They will grow rapidly, covering 8 to 10 feet with luxuriant green, viney growth. All they require is deeply prepared, well drained soil that has been treated with a fertilizer of high potash content. Try a row in the garden this year and you will never be without them again.

Spinach

Time to Sow - For an early crop seed should be sown just as soon as the ground can be worked (about April 1) with successive sowings up to the end of May. This crop runs quickly to seed in hot, dry weather and therefore it is best not to plant again until about August 15 when a Fall crop of Spinach can be sown which will provide greens until frost.

Soil Preparation - Spinach to be succulent and tender must have a really rich soil, well prepared and liberally manured.

Planting Sow the seed thinly in rows; cover with not over 1/2 inch of soil and allow 1 1/2 feet between rows. When the plants are large enough to handle, thin out, leaving about one inch between plants.

1 ounce of seed should sow a 50-foot row

TOMATOES

Time to Sow—It is best to sow indoors in flats, or in coldframes, during April, but seed sown outdoors in early May will produce fruit in September.

Planting—When sowing use a good light sifted loam and broadcast the seed thinly over the surface, cover with not more than $\frac{1}{4}$ inch of soil. When the seedlings are from 2 to 3 inches high they should be given ample space for proper growth. Either transplant or thin out so that they will be about 3 inches apart. After all danger of frost is past these plants should be hardened off, by gradual exposure to the out-of-doors, during favorable weather; transplanting them to the garden about May 20th. Space the plants about 3 feet apart in the rows allowing 4 feet between rows. Closer planting is possible if the plants are to be staked.

The foliage is fernlike and very attractive.

From July until late in the Autumn, they bear a succession of superb long graceful spikes of rich colorful blooms excellent for cutting. A hardy tree of unusual beauty. 4 to 5 foot trees, \$1.00 each, prepaid

FLOWERING CRAB-APPLE TREES

Among the most beautiful of ornamental trees. Although not as tall as regular Apples, they have about the same general form spreading wider than they are in height. Their lovely colorful flowers open in May literally smothering the trees with their glorious profusion. These are followed by a multitude of fruits which color as Autumn approaches and once again the trees become clothed with beauty. Fine lawn trees for the small home grounds.

After the bloom comes capsule-like fruits which burst open when frosty days arrive. The straw colored outer covering folds back exposing brilliant, orange-scarlet, berry-like fruits. Unless the birds eat them, the colorful fruits remain on the vines throughout the Winter, but if the branches are cut and dried about the time of frost, the fruits harden, retaining their vivid coloring. Valuable for Winter, and particularly for holiday decorations. Plant three to insure cross-pollination, and fruit.

Huge juicy berries right in your own back yard—an irresistible treat, and a treat that will be repeated annually for many many years.

Hybrid Blueberries have become amazingly popular for home garden growing because the big luscious berries are so superior, because they make very attractive shrubs, and because they are very easily grown.

They need only be planted carefully in acid soil and where the drainage is good. Several varieties should be planted together to insure cross-pollination and therefore we include at least 3 varieties (of our choice) in each order. *Simple planting and cultural instructions accompany each order.*

Breck's Pot-Grown

Plants set out in the late Summer will bear good crops the following year. *Planting instructions accompany each order.*
